

# The `onlyamsmath` package

Harald Harders  
`h.harders@tu-bs.de`

Version v0.10, 2012/01/01, printed January 1, 2012

## Abstract

This package inhibits the usage of plain  $\text{\TeX}$  and on demand of standard  $\text{\LaTeX}$  math environments. This is useful for class writers who want to force their clients to use the environments provided by the `amsmath` package.

## Contents

<b>1</b>	<b>Usage of the package</b>	<b>1</b>
<b>2</b>	<b>The implementation</b>	<b>2</b>
2.1	Options . . . . .	2
2.2	Commands . . . . .	3

## Copyright

Copyright 2001, 2012 Harald Harders.

## 1 Usage of the package

Just load the package using `\usepackage[options]{onlyamsmath}`. If no option is given only the plain  $\text{\TeX}$  environment  $\$ \$ \dots \$ \$$  is “destroyed”. This environment leads to centred equations even with the global option `fleqn` (*force left equations*) switched on:

$$a = b.$$

`eqnarray` One further option is `eqnarray` to switch off the `eqnarray` and `eqnarray*` environments that add an unwished space before and after the aligned part of the formula as shown here:

$$a = b.$$

A better result is achieved using the `align` environment provided by `amsmath.sty`:

$$a = b.$$

- all** The most brutal option is `all` that inhibits the writer to use any of the `\TeX` and `\LaTeX` math environments for non-inlined equations I know (`$$...$$`, `eqnarray`, `eqnarray*`, `displaymath`. The inlined mathematical modes (`$...$`, `\(...\)`) still work.
- Then instead use the environments provided by `amsmath.sty`: `equation`, `align`, `gather`, `flalign`, `multiline`, `alignat`, and `split`. All environments except `split` have a starred variant. See the User's Guide of the `amsmath` package for further details [1].
- error** There are two more options that control the behaviour of the package if you still use one of the “forbidden” environments. If using `error` which is the default `\LaTeX` generates an error message that reminds you to use the environments of the `amsmath` package.
- warning** If using `warning` `\LaTeX` only produces warnings and proceeds.

## Acknowledgement

David Kastrup (David.Kastrup@t-online.de) has written the part handling `$$`. I just have changed the call of the command producing the error message. Since I do not understand his code please don't ask me things regarding it.

## 2 The implementation

Package header:

```
1 <package>\ProvidesPackage{onlyamsmath}
2 <version>\ProvidesFile{onlyamsmath-v.tex}
3 <package,version> [2012/01/01 v0.10 Destroy the standard math environments]
```

Load `amsmath` package:

```
4 \RequirePackage{amsmath}
```

### 2.1 Options

All options set a boolean variable which is named simular to the option name.

Define the `eqnarray` option:

```
5 \newif\ifonlyams@eqnarray
6 \DeclareOption{eqnarray}{\onlyams@eqnarraytrue}
```

Define the `all` option:

```
7 \newif\ifonlyams@all
8 \DeclareOption{all}{
9   \onlyams@alltrue
10  \onlyams@eqnarraytrue
11 }
```

Define the `error` and `warning` options:

```
12 \newif\ifonlyams@error
13 \onlyams@errortrue
14 \DeclareOption{error}{\onlyams@errortrue}
15 \DeclareOption{warning}{\onlyams@errorfalse}
```

Set the default options:

```
16 \ExecuteOptions{error}
```

Process the options:

```
17 \ProcessOptions\relax
```

## 2.2 Commands

`\onlyams@error` Define a command that produces the error resp. warning messages. The argument specifies the name of the environment that produced the message.

```
18 \newcommand{\onlyams@error}[1]{%
19   \ifonlyams@error
20     \PackageError{onlyamsmath}{Environment #1 used}{Please use only the
21       environments provided by the amsmath package.}%
22   \else
23     \PackageWarning{onlyamsmath}{Environment #1 used, please use
24       \MessageBreak only the environments provided by the amsmath
25       \MessageBreak package}%
26   \fi
27 }
```

Here follows the part that is only executed when one of the options `eqnarray` or `all` is used:

```
28 \ifonlyams@eqnarray
```

`\onlyams@eqnarray` Copy the original `\eqnarray` command which is called by the commands `\begin{eqnarray}` and `\begin{eqnarray*}` to be able to call it after producing the correspondig error message:

```
29 \let\onlyams@eqnarray\eqnarray
```

`eqnarray` Redefine the `\eqnarray` command:

```
30 \def\eqnarray{%
```

First generate an error or warning message:

```
31 \onlyams@error{eqnarray or eqnarray*}%
```

Then call the original `eqnarray` environment:

```
32 \onlyams@eqnarray
```

```
33 \fi
```

Here follows the part that is only executed when the option `all` is used:

```
34 \ifonlyams@all
```

```

displaymath Redefine the \displaymath command:
35   \def\displaymath{%
First generate an error or warning message:
36     \onlyams@error{displaymath}%
Then call the \[ environment which normally is called by the displaymath environment:
37     \[%
38 \fi

Redefine the $$ environment. This part was written by David Kastrup. Please
don't ask me anything about it.

\dollarcode
39 \def\dollarcode{\ifx\protect\@typeset@protect
40   \expandafter\futurelet\expandafter\next\expandafter\checkdsp
41   \else \expandafter$\fi}
42 \begingroup
43 \lccode`\~=`\$
44 \lowercase{\endgroup\let~}\dollarcode

\defdsp
45 \def\checkdsp{\ifx\next\dollarcode\expandafter\ dspcomplain
46   \else\expandafter$\fi}

Now comes the part that I understand and in which I have made changes.

\dspcomplain This command controls the complaint when using $$.
47 \def\dspcomplain#1{%
If mathmode is active the code has found the second $$ of the environment. The
complaint has already made and it is not necessary to do generate one. The
environment has to be closed by using \]:
48   \ifmmode
49     \expandafter \]%
50   \else

If the mathmode isn't active the first $$ of a mathematical environment has been
found. First generate the warning or error message:
51   \onlyams@error{$$ $$}%
Then start the mathmode by using \[:
52     \expandafter \[
53   \fi}

Activate the complaining behaviour at \begin{document} to ensure that packages
that internally use $$ can do that without an error:
54 \AtBeginDocument{\catcode`\$=13 }

```
